

Ardmore Hotels · 3-Minute Demo Runbook

Snowflake Summit · Pediment Booth · for the recorded video walkthrough of the Ardmore Hotels dbt-wizard demo. Looped unattended on the booth screen.

3-5 days

MANUAL MODEL BUILD TODAY

90 sec

DBT-WIZARD BUILD

\$2.6M

WEEKLY REVENUE SOFTNESS

14 hr

EARLIER THAN REVENUE COMMITTEE

ODI architecture · five layers, one loop

Fivetran

Connectors + Custom SDK

MDLS

Managed Data Lake (Iceberg on S3)

dbt Labs

Bronze · Silver · Gold marts

dbt-wizard

Build-time AI · 90s authoring

Snowflake

Reads governed gold layer

DATA ENGINEERS ANCHOR HERE

Architecture · Wizard · Live · Pipeline

Show the loop, the four sub-agents, the materialization, the connector deep-links. This is your DE proof.

BUSINESS USERS ANCHOR HERE

Portfolio Revenue, ADR by Channel, Guest Experience, Loyalty

Show the answers, the KPI tiles, the segments, the executive read. The same governed gold layer powers all of it.

Frame the demo on business outcomes — never functionality

PAIN

The revenue team can't attribute RevPAR drops in time for the Revenue Committee

REASON

Every new attribution = 3-5 day DE backlog

IMPACT

Revenue softness, brand erosion, owner-investor confidence drag

CAPABILITY

Build-time AI on the governed gold layer

PROOF

Live model build in 90 seconds — on screen

The mantra: the win is not that dbt-wizard *can* author a model. The win is that the Chief Revenue Officer walks into the next Revenue Committee with a tested, lineage-tracked answer that did not exist this morning. Every beat below ties to that one sentence.

The 3-minute script · five beats

00:00 – 00:25 Beat 1 · The stakeholder hook

WHAT YOU SAY (25S)

"It is Friday morning at Ardmore Hotels. The Chief Revenue Officer needs to know: Why did RevPAR for Ardmore Grand Sunbelt properties drop 11% week-over-week while Heritage city properties grew 3%? The Revenue Committee happens in 14 hours. Today, an answer like this costs three-to-five days of data-engineering work and a missed meeting. We are about to change that."

WHAT YOU SHOW

Open the **Scenario page** (/scenario). The Chief Revenue Officer's question is the first thing in frame. Let the T-minus counter tick.

OUTCOME → Anchors the audience on a real business question, not a feature.

00:25 – 00:50 Beat 2 · The cost of the gap

WHAT YOU SAY (25S)

"There is no gold-layer mart that answers this. Three days from now, after a request, a backlog, a scope, a build, and a peer review, the engineering team might land it. The Revenue Committee will have already happened. \$2.6 million in weekly revenue softness that compounds if the channel-rate gap stays open — and that is just the dollars we can see."

WHAT YOU SHOW

Stay on Scenario. Highlight the four KPI tiles: 3-5 days, 90s, \$2.6M, T-minus to Revenue Committee.

OUTCOME → Quantifies the cost of the gap. Sets up the 90-second proof.

00:50 – 02:20 Beat 3 · The live build (proof moment · DE-anchor)

WHAT YOU SAY (90S)

"We click Run the Build. Four sub-agents — Explorer, Summary, Worker, Verification — open the dbt project, find the right grain, pull a slice of the gold layer, write the new model, write its tests, and materialize it. The viewer sees the SQL appear character by character. By the time we are done talking, the model exists, the tests pass, the lineage graph has updated."

While narrating, pause once at: "Worker is anchoring the CTE to the grain the Chief Revenue Officer asked for — not a notebook-grade approximation." Then again at: "Verification is writing a uniqueness test on the natural key. This is a governed gold asset, not a SQL snippet."

WHAT YOU SHOW

Click into [/wizard-live](#). Let the playback run at 1x. The agents type SQL and YAML in real time. The step rail moves Discovery → Schema → Inspection → Model Creation → Tests → Materialization. Terminal-window aesthetic.

OUTCOME → Data engineers see the loop end-to-end. The wow is that the output is a tested, governed asset — not a snippet pasted into Slack.

02:20 – 02:45 Beat 4 · The outcome (P&L tie-back · business-anchor)

WHAT YOU SAY (25S)

"The new mart is materialized. The Revenue Committee convenes in 14 hours, not three days. The Chief Revenue Officer walks in with the answer: five Sunbelt Grand properties share an OTA-direct rate-parity issue; the OTA channel underpriced Ardmore Grand by 7-12% on Tue-Wed bookings — channel-rate fix, not a yield-management overhaul. That is a channel-rate fix, not a yield-mgmt overhaul. And the next time anyone asks this question — group, leisure, government, anywhere — the model is already there."

WHAT YOU SHOW

Cut to [/outcome](#). Materialized model, tests passed, lineage updated, root-cause panel, impact panel. Then quick scroll through the business-user pages (Portfolio Revenue, ADR by Channel, Guest Experience, Loyalty) so the audience sees the same gold layer powering the executive read.

OUTCOME → Closes the loop from question to action AND shows the business-user surface running on the same data.

02:45 – 03:00 Beat 5 · The architectural ask

WHAT YOU SAY (15S)

"Fivetran lands every source. MDLS owns the open lake. dbt governs the layer. dbt-wizard authors the gaps. Snowflake reads it. That loop closes for RevPAR attribution, channel-rate drift, ADR optimization, and brand-portfolio rebalance — all on the same governed lake. Want to see how this maps to your gold layer? Stop by the Pediment booth or scan the QR."

WHAT YOU SHOW

Final card with the five-pillar loop, QR code to [fivetran.com/contact](#). Tag dbt Labs co-brand.

OUTCOME → Calls out the architectural pattern. Invites a discovery conversation.

Business outcomes to weave through — never lead with features

OUTCOME THE BUYER FEELS	WHAT IT REPLACES	HOW TO PHRASE IT
Revenue Committee gets the answer same-day	3-5 day DE backlog	"In time for the meeting, not three days late"

OUTCOME THE BUYER FEELS	WHAT IT REPLACES	HOW TO PHRASE IT
\$2.6M exposure sized in 90 seconds	Open gap window	"The cost of the gap closed before lunch"
Reusable governed mart for every future ask	One-off notebook scripts	"The next person who asks gets it for free"
CDO does not add headcount to keep up	Hiring DE backfill	"Your team stops being the bottleneck"
Auditor sees lineage + tests, not a query history	Manual evidence packs	"Examiner-ready by default"

Anti-patterns · what NOT to say

- **Don't say:** "It runs dbt show against the warehouse and authors a new model file." **Say:** "Ninety seconds from question to materialized answer."
- **Don't say:** "Cortex Analyst." Cortex is intentionally absent from this demo. The story is build-time AI on the governed lake.
- **Don't say:** "dbt-wizard generates SQL." Say: "dbt-wizard authors a governed asset — schema contract, tests, lineage, ownership."
- **Don't say:** "Look at the typing animation." The animation is the texture, not the value.
- **Don't open with the architecture diagram.** Open with the Chief Revenue Officer's question. Architecture is the closer.
- **Don't skip the business pages.** After the wizard finishes, scroll through Portfolio Revenue, ADR by Channel, Guest Experience, Loyalty so the audience sees the persona surface that runs on the same gold layer.

Discovery prompts to anchor before the demo (if presenting live)

BEFORE YOU PRESS PLAY

- "What questions does your Chief Revenue Officer ask that your team cannot answer same-day?"
- "When a stakeholder asks for a new cut of data, what is the average time from ask to merged dbt model?"
- "How many one-off SQL scripts are sitting in someone's Snowflake history that never made it back into the governed layer?"
- "Who is your Economic Buyer for new data investment? Likely audience: CRO, VP Distribution, Brand Presidents."

AFTER THE DEMO LANDS

- "Which of those agent steps — Discovery, Schema, Inspection, Model Creation, Tests, Materialization — is where your team spends the most time today?"
- "If we sized a pilot on three of your highest-value recurring Chief Revenue Officer questions, what would success look like in 90 days?"
- "Who needs to be in a 30-minute architecture review to see how this lands on your gold layer? Audience: CRO, VP Distribution, Brand Presidents."

Personas at the booth — split the time

DATA ENGINEER · 60% OF BOOTH TIME

Scenario → Live → Outcome → Architecture → Pipeline

Lead with the question, show the four sub-agents, then walk the architecture (Fivetran + MDLS + dbt Labs + dbt-wizard + Snowflake) and the Pipeline page with real Fivetran connector deep-links.

BUSINESS USER · 40% OF BOOTH TIME

Portfolio Revenue, ADR by Channel, Guest Experience, Loyalty

After the wizard finishes, drop into the dashboard pages. Show that the same governed gold layer powers the CRO, VP Distribution, GMs, Brand Presidents read. The build-time AI is invisible to them — they see the answer.

Required follow-up materials

- One-pager · Ardmore Hotels · at fivetran-jasonchletsos.github.io/Fivetran-Demo-Repository/one-pager/hospitality-travel/
- Live demo URL · fivetran-jasonchletsos.github.io/Hospitality-Travel-ODI-Demo/
- 3-minute walkthrough video (this recording)
- Architecture diagram on the Architecture tab of the demo
- Cross-industry credibility · Storefront

Booth-floor reminder: the demo is built to run unattended on the booth screen. If a prospect walks up mid-playback, do not restart. Pick up the narration where the playback is — that is also the point. The build finishes whether someone is watching or not. That is the entire pitch.
